DNA / RNA

HLD4 formulation is proven to denature / precipitate DNA / RNA immediately at dilutions of 1:20 or 1:50 according to Cambridge University Technical Services

"Further to your query regarding the efficacy of Medimark Scientific Limited's product HLD4, CUTS can report that at dilutions of HLD4 less than 1:100 (v/v)—1:20 or 1:50 for example—nucleic acids are precipitated immediately. For such dilutions (less than or equal to 1:100), the contact time for immersed solutions should be a few minutes at maximum. The product was not tested in aerosol form. However, it is likely that if the concentrations of HLD4 in an aerosol formulation is similar and the active ingredients are stable that it would behave similarly."
